PROJECT DESIGN PHASE

# Proposed Solution

ServiceNow-Based Employee Laptop Request Application

| | |
|---|---|
| **Project Name** | ServiceNow-Based Employee Laptop Request Application |
| **Maximum Marks** | 2 Marks |

## Proposed Solution Details

| | | |
|---|---|---|
| 1 | **Problem Statement** | Laptop requests may be submitted through scattered messages or inconsistent forms. This can result in missing information, unclear approval ownership and repeated follow-ups to check request status. |
| 2 | **Idea / Solution Description** | Use a ServiceNow Record Producer or Service Catalog form to capture laptop request details. Flow Designer initiates manager approval, records the decision and supports relevant email notifications and status updates. |
| 3 | **Novelty / Uniqueness** | The solution brings request submission, manager approval and communication into one traceable workflow. It uses ServiceNow platform capabilities rather than relying on separate forms, emails and manual hand-offs. |
| 4 | **Social Impact / Customer Satisfaction** | Employees can receive clearer status updates, managers have a defined approval action, and IT staff can work with more consistent request information. This may reduce avoidable back-and-forth and improve the user experience. |
| 5 | **Business Model (Revenue Model)** | This is an internal enterprise solution with no direct revenue expected from employees. Its value is operational: less manual coordination and clearer accountability. Costs depend on existing ServiceNow licensing, configuration and support. |
| 6 | **Scalability of the Solution** | The workflow can be extended with additional request categories or fields and reused for other equipment requests. Inventory, procurement or delivery integrations could be considered later if the required systems and approvals are available. |

*Note: Benefits described above are expected outcomes and should be validated with employees, managers and IT staff. Inventory, procurement and delivery integrations are future possibilities, not assumed current features.*
